

**In the Abstract:**

Please amend the abstract as follows:

A mobile device or MS 44 having voice user interface (UI) as part of its multimodal input/output capabilities is provided with a storage area 48 for storing a profile indicating the voice UI capabilities. The profile indicates the automatic speech recognition, text-to-speech, vocabulary and grammar capabilities, amongst others. An application, such as a diary program or one allowing entry into a lotto, is initialized on the MS 44 with reference to the profile. When the application is run, the profile is referred to such that parts of the application which are appropriate to the profile are run whilst those which are inappropriate to the profile are not run. Alternatively, the application may be run on a voice UI application server 24 forming part of a base station 42. An emulator (Figure 4) for testing an application using a profile of a target device is also disclosed.
